

Abstract of the Disclosure:

An electrical appliance includes at least one sensor for recording at least one operating parameter and at least one actuator for influencing at least one operating parameter of the electrical appliance. The at least one sensor and the at least one actuator are conductively coupled with a central computing and control unit for controlling the electrical appliance. The central computing and control unit is coupled with a communication unit that allows a wireless communication with an external remote station. The communication unit is, preferably, a transponder for wireless radio communication.
